MASON

The Statue of Liberty. Big Ben. The Shinto Pagoda. All marvels of architectural engineering. And then there's Mason, the BL6 mouse. Mason is a genetic marvel - built brick by proverbial brick - on a foundation of science. A strain commonly used in model creation, Mason has building in his blood. Working from his genetic blueprint - an alphabet soup of A's, C's, T's and G's - scientists can create ideal humanized models for research. Mason has been a part of Charles River's

portfolio since 1974. Like any builder, he has many tools in his tool belt. In addition to transgenic/knockout model development, Mason has cemented his way into various research applications, including immunology, metabolism, aging, diet-induced obesity and safety and efficacy. Even after almost 40 years, Mason continues to reinforce the solid foundation of science he was built on. Use Mason to create your own engineering marvel, and let's build the future together.
